Welcome to the Genpact AP Capture Release Notes.

What's in the Release Notes?

- About Genpact AP Capture
- Main features
- Known issues

About Genpact AP Capture

Genpact AP Capture is a GenAI and ML supported standalone independent solution that integrates with AP Flow and other systems using the webAPI, and provides end-to-end capability to extract data. The Genpact AP Capture solution extracts not only the header data but also the line level data from different documents efficiently and automates data extraction, classification and validation.

Automating the extraction and validation reduces manual processing and error occurrence, and increases accuracy. With Genpact AP Capture, the AP process becomes faster, more accurate, and more secure, allowing the customer to focus on strategic decision-making. Efficient AP management with Genpact AP Capture enhances cash flow, reduces costs, and strengthens partnerships, and helps in business sustainable growth.

Main features

- Create a case through email: The file listener configured in the Genpact AP Capture enables receiving documents (invoices) on email and create a case for them.
- APFlow adaptor: The APFlow adaptor integrates the Cora APFlow capabilities with the Genpact AP Capture to streamline the AP processing.
- Classification: Document classification and intelligent queueing, to fast-track high priority invoices.
- Extraction: The Genpact AP Capture comes with DocIntel for improved extraction of accurate header and line level data from the documents.
- Validation: Optimized and expedited data extraction and validation, based on the criticality, with minimum human intervention.
- Enrichment and Eyeballing: An intuitive UI to validate and update incorrect/missing data, and capture human feedback for continuous learning.
- Document split: Easy split of lengthy document into multiple documents based on factors like a blank pages between the documents, a blank page with strong label, page numbering, or a barcode with static label.
- Additional charges identification: With Genpact AP Capture, you can identify the additional charges in an invoice and add these in header data for further processing, without getting an error.

Known issues

Issue	Description
1	System doesn't support .tiff files/documents.
2	The eyeball polygon UI is affected when displayed horizontally.

Issue	Description
3	For the extraction model yaml file has more than 1 item (grid or table), the eyeball tasks display only one random table.
4	Weight field is not extracting with pre-built invoice model.
